🏠   Getting started   Deploy dedicated server

Version: 0.6.0

Deploy dedicated server

On this page, you will learn how to build a dedicated server.

Setup steam or steamcmd

Windows with Steam   Windows with SteamCMD   **Linux with SteamCMD**

Follow the Official document to install SteamCMD.
Please install according to the Linux distribution you are using.

Download the Dedicated server

Windows with Steam   Windows with SteamCMD   **Linux with SteamCMD**

Exec the following command to download the dedicated server.

```
steamcmd +login anonymous +app_update 2394010 validate +quit
```

Startup the Dedicated server

Windows with Steam   Windows with SteamCMD   **Linux with SteamCMD**

change to the download directory.
Usually under the user's home directory, but if you have set up an installation directory for SteamCMD, please refer to it.

```
cd ~/Steam/steamapps/common/PalServer
```

To start the server, exec the `PalServer.sh` script.

```
./PalServer.sh
```
